

Section - I: Multiple Choice Questions

1. What is the primary characteristic of a model that is experiencing underfitting?
 - A) The model is too complex and performs well on the training data but poorly on new data.
 - B) The model is too simple and fails to capture the underlying patterns in the data.
 - C) The model is biased towards a particular class or group in the dataset.
 - D) The model is able to fit the training data perfectly but fails to generalize well.
2. What is the primary difference between overfitting and underfitting in machine learning models?
 - A) Overfitting occurs when a model is too complex, while underfitting occurs when it is too simple.
 - B) Overfitting occurs when a model is too simple, while underfitting occurs when it is too complex.
 - C) Overfitting is a type of bias, while underfitting is a type of variance.
 - D) Overfitting is a type of variance, while underfitting is a type of bias.
3. What is a common indication of overfitting in a machine learning model?
 - A) The model performs well on both training and testing data.
 - B) The model performs well on training data but poorly on testing data.
 - C) The model performs poorly on both training and testing data.
 - D) The model is unable to learn from the training data.
4. What is a common indication of overfitting in a machine learning model?
 - A) The model performs well on the training data but poorly on the test data.
 - B) The model performs equally well on both the training and test data.
 - C) The model performs poorly on both the training and test data.
 - D) The model requires a large amount of data to train.
5. What is the primary difference between overfitting and underfitting in machine learning models?
 - A) Overfitting occurs when a model is too complex, while underfitting occurs when a model is too simple.
 - B) Overfitting occurs when a model is too simple, while underfitting occurs when a model is too complex.
 - C) Overfitting occurs when a model is trained on too much data, while underfitting occurs when a model is trained on too little data.
 - D) Overfitting occurs when a model is trained on too little data, while underfitting occurs when a model is trained on too much data.
